Hydrogels, due to their unique biocompatibility, flexible methods of synthesis, range of constituents, and desirable physical characteristics, have been the material of choice for many applications in regenerative medicine. They can serve as scaffolds that provide structural integrity to tissue constructs,

Injectable hydrogels are one of the most widely investigated and versatile technologies for drug delivery and tissue engineering applications. Hydrogels' versatility arises from their tunable structure, which has been enabled by considerable advances in fields such as materials engineering, polymer science, and chemistry.

1. Introduction. Hydrogels have been used in various biomaterial and biotechnology applications such as tissue engineering [], artificial organs [] and drug delivery [3-6] as well as for drug carriers especially for proteins []. Biodegradation is considered a critical requirement for most hydrogel applications since surgical removal from the body is painful at best.
