For the linear operator L in your question, it's a linear transformation in R 2. To define a linear operator on the vector space, in your word, to "find" a linear operator, one needs to define the the image of the basis of the vector space under the map.

A scalar valued linear map on a vector space V is a linear functional. A linear map is frequently called a linear transformation, and, in case the domain and codomain are the same, it is often called a (linear) operator. The family of all linear transfor- mations from V into Wis denoted by L(V,W).

FINITE DIFFERENCE APPROACH TO FOURTH-ORDER LINEAR BOUNDARY-VALUE PROBLEMS MATANIA BEN-ARTZI AND BENJAMIN KRAMER Abstract. Discrete approximations to the equation Lcontu = u(4)+D(x)u(3)+A(x)u(2)+(A'(x)+H(x))u(1)+B(x)u = f, x ∈ [0,1] are considered. This is an extension of the Sturm-Liouville case D(x) = H(x) = 0 [5] to the non-self ...

Operation research is an approach to decision-making, which involves a set of methods to operate a system. In the above example, my system was the Delivery model. Linear programming is used for obtaining the most optimal solution for a problem with given constraints. In linear programming, we formulate our real-life problem into a mathematical model.
